

SmartStage[®]
Connect

Elevate Your Personal Communications

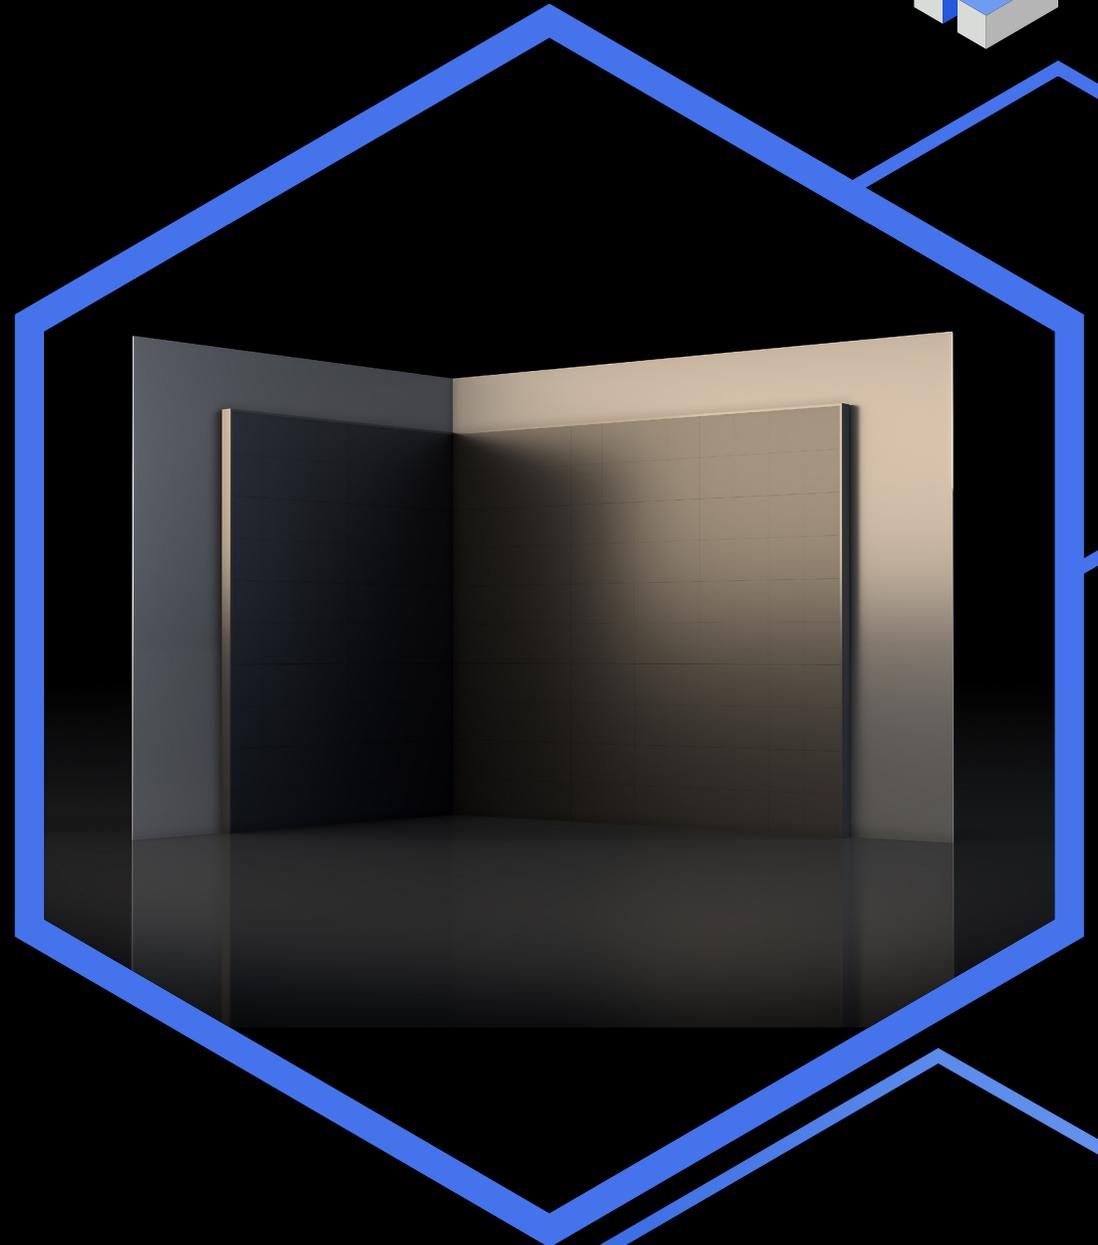

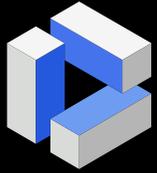

SmartStage® Connect offers the wide-ranging benefits of an immersive XR solution, at a cost and space-effective entry level.

Its compact and flexible design is ideal for small rooms and office areas where space is at a premium, creating a heightened professional environment for meetings and presentations.

The system includes two high-resolution LED walls, which can be installed in any location utilising a low-profile ground support frame system or simply bolted to suitable walls. The system has been designed to fit in low ceiling height office environments. Lighting can be attached to a suitable ceiling structure, or mounted on free-standing supports, along with the cameras and courtesy monitors.

Sleek and Streamlined

Extend Your Reality

A pan/tilt/zoom robotic camera is provided to capture the output directly from SmartStage® Connect and feed this into the processor, which adds a seamless virtual extension beyond the LED walls.

The low-profile camera can be discreetly integrated into the building fabric and programmed with pre-set camera positions to cover any presentation requirement. Additional cameras can be added as an optional upgrade.

As well as creating full 3D virtual worlds in the background, SmartStage® Connect allows augmented reality 3D objects to be placed within the foreground surrounding your host, to enhance presentations. These elements could be graphs, logos, or props for example, to help reinforce the subject matter and bring this to life.

Software-based video conferencing platforms are fully integrated into SmartStage® Connect, allowing remote colleagues and clients, as well as shared content, to also appear within the environment surrounding the host.

SmartStage® Connect makes video conference integration an intuitive and seamless experience. Simply plug your laptop or presentation content into the system, join a meeting from the built-in video conferencing platform and you are ready to go!

The production output from the stage can be fed directly to a video conference call, delivered to a live stream, or archived as a digital recording.

SmartStage® Connect gives you additional options at the point-of-sale, for two lapel radio microphones or a ceiling-mounted microphone array. These ensure professional quality audio capture of your presentation for crystal clear audio transmission to your remote audience.

SmartStage® Connect is entirely user-driven through this intuitive touch-screen display, giving the host autonomy to control all content

The user can cut full screen to their presentation, or any video conferencing outputs from the iPad control interface, to help highlight specific content or focus on remote collaborators. Effortlessly switching camera shots, screen positions, source content and virtual world backdrops.

The SmartStage® Connect system includes:

- 3m x 2m x 2.3m high-resolution broadcast-grade LED wall
- Virtual set extension and augmented reality elements
- Render engines supported: Unreal Engine, Unity and Notch
- Integrated video conferencing and streaming platform
- Intuitive, user-driven control, via a fixed touch panel & mobile tablet
- One fixed position pan/tilt/zoom robotic camera
- Broadcast quality lighting, audio capture and vision mixing
- Configurable presenter courtesy monitors
- System upgrades include LED wall size, camera packages, presenter tracking, tracked AR props, teleportation features, radio microphones and much more

Systems Integration

The core system will be delivered as a self-contained, racked solution with patch panels for connectivity to the building's main infrastructure and any locally provided sources. This significantly reduces the installation and setup time needed on site.

IP-based KVM's, network switching, and signal/data distribution is supplied and installed within the rack to allow for remote operation of all servers and devices.

An iPad and wired touch-panel interface is provided for triggering of presets and user-driven content control within SmartStage® Connect. The iPad is included with a charging docking station. A dedicated wireless access point and firewall router is also provided to enable self-contained wireless control and remote support options.

Professional Services & Support

White Light will fully install and commission the SmartStage® Connect solution on-site. If the pre-installation survey indicates that any structural, electrical or HVAC works are required, White Light's Installations team will assist in managing your third-party vendors to complete all works to the required level, prior to installation.

Your SmartStage® comes with full training in user operation and first-line technical support for the SmartStage® Connect solution.

A range of options are available for Service Level Agreements, including hardware and software maintenance packages, providing tailored support for your XR studio – all managed from our dedicated Operations Centre.

All SmartStage® products come with a fully branded, multi-location, virtual world. This allows your team to gain hands-on training and develop their skills in XR and system utilisation from the outset. We also include a few complimentary demonstration virtual stage concepts, to inspire your creative team for the design of your next virtual world. Bespoke virtual environments can also be provided via our worldwide creative partner network.
